Sharif University of Technology Department of Computer Engineering Compiler Course Project Fall 1396

Handout 6 - Instruction specification

1 Instructions

Instructions appear in one line of output each and will have the following format:

 $[OpCode][Opr_1]...[Opr_n]$

Where the number of operands (n) is determined for each instruction separately. All of the required instructions in L is listed in table below. If you need any instructions that is not listed here, please inform me

Note: The last three instructions will be discussed in project's extra class.

Operator Name	OpCode	#of Operands	Operation
Add	+	3	$[Opr3] \leftarrow [Opr1] + [Opr2]$
Subtract	_	3	$[Opr3] \leftarrow [Opr1] - [Opr2]$
Multiply		3	$[Opr3] \leftarrow [Opr1] [Opr2]$
Divide	/	3	$[Opr3] \leftarrow [Opr1] / [Opr2]$
Mod	%	3	$[Opr3] \leftarrow [Opr1] \% [Opr2]$
Logical And	&&	3	$[Opr3] \leftarrow [Opr1] \&\& [Opr2]$
Logical Or		3	$[Opr3] \leftarrow [Opr1] \mid \mid [Opr2]$
Binary And	&	3	$[Opr3] \leftarrow [Opr1] & [Opr2]$
Binary Or		3	$[Opr3] \leftarrow [Opr1] \mid [Opr2]$
Binary Xor	^	3	$[Opr3] \leftarrow [Opr1] \land [Opr2]$
Binary Not	~	3	$[Opr2] \leftarrow \sim [Opr1]$
Less Than	<	3	$[Opr3] \leftarrow [Opr1] < [Opr2]$
Greater Than	>	3	$[Opr3] \leftarrow [Opr1] > [Opr2]$
Less Than Equal	<=	3	$[Opr3] \leftarrow [Opr1] \le [Opr2]$
Greater Than Equal	>=	3	$[Opr3] \leftarrow [Opr1] >= [Opr2]$
Equal	==	3	$[Opr3] \leftarrow [Opr1] == [Opr2]$
Not Equal	! =	3	$[Opr3] \leftarrow [Opr1]! = [Opr2]$
Logical Not	!	2	[Opr2] ←! [Opr1]
Unary Minus	u-	2	$[Opr2] \leftarrow -[Opr1]$
Assignment	:=	2	$[Opr2] \leftarrow [Opr1]$
Jump Zero	jΖ	2	if $[Opr1] == TRUE$ then $pc \leftarrow [Opr2]$
Jump	jmp	1	$pc \leftarrow [Opr1]$
Write Integer	wi	1	$\{\text{output}\} \leftarrow [\text{Opr1}]$
Write Float	wf	1	$\{\text{output}\} \leftarrow [\text{Opr1}]$
Write Text	wt	1	$\{\text{output}\} \leftarrow [\text{Opr1}]$
Read Integer	ri	1	$\{\text{input}\} \rightarrow [\text{Opr1}]$
Read Float	rf	1	$\{input\} \rightarrow [Opr1]$
Get Memory	gmm		Set Opr2 the address of firt byte of memmory with size Opr1
Free Memory	fmm	2	Free memory starts at Opr1 with size Opr2
PC Value	:= <i>pc</i>	1	[Opr1] ← pc
SP Value	:= <i>sp</i>	1	$[Opr1] \leftarrow sp$
Assign SP	<i>sp</i> :=	1	$sp \leftarrow [Opr1]$

1.1 Operands

Each of the operands of the following format:

[Addressing Mode] [Type] [Value]

You have to concatenate their text values in order to obtain the operand. For immediate addressing, value will be the literal (for a character, you will write it's ASCII code). In other kind of addressing, value will be a memory address (integer).

1.2 Addressing Modes

in L we will need at most five kind of addressing mode.

Addressing Mode	Text Form
Global Direct	gd_
Global Indirect	${ m gi}$
Local Direct	ld_
local Indirect	1i_
immediate	im_{-}

1.3 Types

Type	Text Form
Integer	i_
Float	\mathbf{f}_{-}
Boolean	b_{-}
String	S_{-}
Char	\mathbf{c}_{-}

2 Example

In this section you can see some examples from instructions in text form. the white space between operator and operands can be a single space or tab.

```
+ gd_i_12 im_i_5 ld_i_14
wi im_c_13
* gi_f_10 im_f_10.5 ld_f_10
gmm im_i_1024 gd_i_1
wi gi_i_1
+ im_i_1 im_i_2 gi_i_1
wi gi_i_1
fmm gd_i_1 im_i_1024
```
